

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Snowy Owl and Golden Eagle at Plymouth, Michigan.—A Snowy Owl (Nyctea nyctea) was shot at Plymouth, Michigan, on December 4, 1901. It was a male bird, and its stomach contained no food.

Recently a Golden Eagle (Aquila chrysaëtos canadensis) was caught near here—the second one observed at this place. These birds are becoming quite rare in southern Michigan, and a law should be enacted for their protection, and not only for them but for several other species of our hawks and owls.—James B. Purdy, Plymouth, Mich.

The Hawk Owl in Massachusetts.—I found lately in the Bryant Collection in the Museum of Comparative Zoölogy two specimens of Surnia ulula caparoch. The label on one reads "Massachusetts, December 30, 3," (No. 1524); on the other, "Massachusetts, 3," (No. 1525). As no Massachusetts specimen has been recorded as taken on December 30, this bird is evidently unrecorded, and makes the thirteenth record for the State. The other specimen may be one of those already recorded of which we have no other data as to the capture.—REGINALD HEBER HOWE, Jr., Longwood, Mass.

The Elf Owl as a California Bird. — So far as I am aware the chief, if not the only, claim *Micropallas whitneyi* has in the literature to the rank of a California bird rests upon the type specimen. The paper (Proc. Calif. Acad. Nat. Sci., Vol. II, p. 118) containing the original description of this specimen is entitled 'New Californian Animals', but the locality given for the specimen is Fort Mojave, which was on the Arizona side of the Colorado River. Positive evidence of the occurrence of this owl in California has recently come to my knowledge in an example (now No. 18298, Calif. Acad. Sci.) obtained April 20, 1898, by Mr. J. A. Kusche in San Bernardino County, the precise locality being about ten miles from San Bernardino on the old Toll Road, altitude about 2000 feet. — Leverett M. Loomis, California Academy of Sciences, San Francisco.

Unusual Abundance of Lewis's Woodpecker near Tucson, Arizona, in 1884. — During the fall of 1884 Lewis's Woodpecker (Asyndesmus torquatus) appeared in large numbers in the Santa Cruz Valley, opposite Tucson, Arizona. Although I have been a resident of the place for about twenty-four years it was the only time I ever saw them in that neighborhood. The following concerning them is from my note-book of that date.

September 28. To-day I saw what appeared to be a large black woodpecker in the pomegranate groves west of town. It was wild and unapproachable. It kept much among the small trees.

September 20. To-day I fortunately secured the black woodpecker I saw yesterday. It proves to be a young female of A. torquatus. The cervical collar is entirely wanting. So far as I can remember it is the only one I ever met with in southern Arizona.
